

Info sheet

Erasmus+ - Strategic Partnership Project „QualiProSH Electro“ - Business field specific qualification for the Second-Hand sector „Specialist for used electrical appliance“

Within the framework of the project „QualiProSH Electro" should be developed basing on the results of the previous projects "QualiProSecondHand" and "QualiProSH II" a European qualification concept "Specialist for used electrical appliance" for the Second-Hand sector in cooperation with 5 European countries (Germany, Austria, Finland, Slovenia and Bulgaria). It should be adapted and tested with the target group "employees / qualifier in the Second-Hand sector" and implemented in a sustainable way. As a basis for the development of the qualification serve both the work process related analysis results of the previous project and on the other hand the already developed qualification modules and their structure as well as complementary products such as quality standards, tools for competence identification and quality check that were developed in the project "QualiProSH II".

Within the framework of the project „QualiProSH Electro“ should be added to the already in the previous project developed qualification modules et al „administration business processes, purchase of goods, acquisition of goods/customers, sales and organization of goods receipts“ three specific and two social skills promoting (incl. teaching and learning materials) qualification modules that have to be developed. All modules should be summarized to a specific overall qualification. Specifically, the following modules are to be mentioned:

- Storage and transport of used electrical appliance
- Cleaning and repairing of used electrical appliance
- Dismantling and disposing of used electrical appliance
- Social skills I (personal competencies)
- Social skills II (employee and customer related skills)

From the total of 10 qualification modules and against the background of already existing quality standards each partner country will develop a national qualification concept by taking into account their special national conditions and test and optimize the qualification concept. Furthermore an European overall qualification concept "specialist for used electrical appliance" will be developed for the transfer to other EU-countries. This concept can be used one on one or for any necessary adaptation to the particular national conditions of the VET systems of the different EU-countries. Furthermore, selected core contents of the 10 modules are prepared as webinars against the background of the increased use of digital media for learning and a guideline for the use of webinars will be created. In addition, an assessment instrument to identify the competencies that focus the competencies that are taught in the modules will be developed (incl. a guideline for the use) as well as a guideline for implementing and financing the qualification will be created.

Through the development of the above-mentioned qualification and complementary products should be open a new occupational field for the disadvantaged in the labor market and developed an EU-wide uniform new qualification. Against the background of the protection of resources and the reuse of goods should contribute the further professionalization of the Second-Hand sector as well as the recognition of the specific activities and the labor market mobility.
